ART UNIT	PAPER NUMBER
2618	

MAIL DATE	DELIVERY MODE
04/15/2008	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE *3* MONTH(S) OR THIRTY (30) DAYS,
WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed
  after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any
  earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *01 February 2008*.

2a)☐ This action is **FINAL**.   2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is
closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-60* is/are pending in the application.

   4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-4,7,12-16,18-24,26,31,32,35-44,46-52 and 54-60* is/are rejected.

7)☒ Claim(s) *5, 6, 8-11, 17, 25, 27-30, 33, 34, 45, 53* is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

   Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

   Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

   a)☐ All   b)☐ Some * c)☐ None of:

   1.☐ Certified copies of the priority documents have been received.

   2.☐ Certified copies of the priority documents have been received in Application No. _____.

   3.☐ Copies of the certified copies of the priority documents have been received in this National Stage
   application from the International Bureau (PCT Rule 17.2(a)).

   * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1)☒ Notice of References Cited (PTO-892)
2)☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3)☒ Information Disclosure Statement(s) (PTO/SB/08)
   Paper No(s)/Mail Date _____.

4)☐ Interview Summary (PTO-413)
   Paper No(s)/Mail Date. _____.
5)☐ Notice of Informal Patent Application
6)☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

> Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

1.   Claim 57 is rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claim 3 is drawn to a "a computer readable media" *per se* as recited in the preamble and as such is non-statutory subject matter. See MPEP § 2106.IV.B.1.a. Data structures not claimed as embodied in computer readable media are descriptive material *per se* and are not statutory because they are not capable of causing functional change in the computer. See, e.g., *Warmerdam*, 33 F.3d at 1361, 31 USPQ2d at 1760 (claim to a data structure *per se* held nonstatutory). Such claimed data structures do not define any structural and functional interrelationships between the data structure and other claimed aspects of the invention, which permit the data structure's functionality to be realized. In contrast, a claimed computer readable medium encoded with a data structure defines structural and functional interrelationships between the data structure and the computer software and hardware components which permit the data structure's functionality to be realized, and is thus statutory. Similarly, computer programs claimed as computer listings *per se*, i.e., the descriptions or expressions of the programs are not physical "things." They are neither computer components nor statutory processes, as they are not "acts" being performed. Such claimed computer programs do not define any structural and functional interrelationships between the

computer program and other claimed elements of a computer, which permit the

computer program's functionality to be realized.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set
> forth in section 102 of this title, if the differences between the subject matter sought to be patented and
> the prior art are such that the subject matter as a whole would have been obvious at the time the
> invention was made to a person having ordinary skill in the art to which said subject matter pertains.
> Patentability shall not be negatived by the manner in which the invention was made.

1.   Claims 1-4, 7, 12-16, 18-24, 26, 31, 32, 35-44, 46-52, 54-60 are rejected under

35 U.S.C. 103(a) as being unpatentable over Fitton et al (US 20040028013) in view of

Smee et al (US 6,990,137) further in view of Grant et al (US 20050195889).

As to claims 1, 21, 57, Fitton teaches a method of estimating an correlation in a

spread spectrum wireless receiver comprising: estimating a first correlation (see fig. 5,

numbers 514 1-N, paragraphs 0090-0094) based on despread symbols received over

multiple paths of a multi-path channel; estimating a second correlation (see fig. 5,

numbers 514 1-N, paragraphs 0090-0094) based on the despread symbols; and

deriving a final correlation (see fig. 5, number 528, paragraphs 00900-0094) based on

the first and second correlation. Fitton fails to teach wherein the correlation is the

correlation matrix. Smee teaches wherein the correlation is the correlation matrix (see

fig. 13, number 308, col. 22, lines 23-65. Therefore, it would have been obvious to one

of ordinary skill in the art at the time the invention was made to provide the teaching of

Smee into the system of Fitton in order to trade off noise suppression through averaging

and ability to track channel variation. The combination of Fitton and Smee fails to teach

wherein the correlation is the impairment correlation. Grant teaches wherein the

correlation is the impairment correlation (see paragraphs 0033, 0035, 0039-0041).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the

invention was made to provide the teaching of Grant into the system of Fitton and Smee

in order to detect the signal of interest within the received composited signals.

As to claims 2, 22, 42, 50, 58, the combination of Fitton, Smee and Grant

teaches wherein deriving the final impairment correlation matrix based on the first and

second impairment correlation matrices comprises selecting one of the first and second

impairment correlation matrices as the final impairment correlation matrix (see Fitton fig.

5, number 528, paragraphs 0090-0094).

As to claims 3, 38, 39, 43, the combination of Fitton, Smee and Grant teaches

wherein selecting one of the first and second impairment correlation matrices as the

final impairment correlation matrix comprises selecting the first impairment correlation

matrix as the final impairment correlation matrix when a color of the first impairment

correlation matrix meets or exceeds a predetermined color criteria (see Fitton

paragraphs 0080-0088).

As to claims 4, 23, 51, 59, the combination of Fitton, Smee and Grant teaches

wherein selecting one of the first and second impairment correlation matrices comprises

combining the first and second impairment correlation matrices (see Fitton fig. 5,

number 528, paragraphs 0090-0094).

As to claims 7, 26, 44, 52, the combination of Fitton, Smee and Grant teaches

wherein estimating the second impairment correlation matrix based on the despread

symbols comprises estimating the second impairment correlation matrix based on the

first impairment correlation matrix (see Fitton fig. 5, number 528, paragraphs 0090-

0094).

As to claims 12, 31, the combination of Fitton, Smee and Grant teaches

comprising generating a despread error vector based on the despread values, wherein

estimating the first and second impairment correlation matrices based on the despread

symbols comprises estimating the first and second impairment correlation matrices

based on the despread error vector (see Smee fig. 9, number 244, col.20, lines 35-65,

col. 21, lines 55-67, col. 22, lines 1-22).

As to claims 13, 46, 54, the combination of Fitton, Smee and Grant teaches

wherein estimating the first impairment correlation matrix based on the despread

symbols comprises determining channel estimates based on the despread symbols

(see Fitton paragraphs 0080-0088) and estimating a parametric impairment correlation

matrix based on the channel estimates (see Fitton fig. 5, number 528, paragraphs 0090-

0094).

As to claims 14, 47, 55, the combination of Fitton, Smee and Grant teaches

wherein estimating the second impairment correlation matrix based on the despread

symbols comprises estimating a non-parametric impairment correlation matrix based on

the despread symbols (see Fitton fig. 5, number 528, paragraphs 0090-0094).

As to claim 15, the combination of Fitton, Smee and Grant teaches further

comprising generating weighting factors based on the final impairment correlation matrix

and combining traffic despread symbols using the weighting factors to suppress

interference (see Fitton fig. 5, number 528, paragraphs 0090-0094).

As to claim 16, the combination of Fitton, Smee and Grant teaches further

comprising estimating a signal-to-interference ratio based on the final impairment

correlation matrix (see Fitton fig. 5, number 528, paragraphs 0090-0094).

As to claim 18, the combination of Fitton, Smee and Grant teaches wherein the

spread spectrum wireless receiver comprises a RAKE receiver (see Fitton fig. 5,

paragraphs 0090-0094).

As to claims 19, 40, 48, 56, 60, the combination of Fitton, Smee and Grant

teaches wherein the wireless spread spectrum receiver is disposed in at least one of a

mobile station and a base station (see Fitton fig. 5, number 528, paragraphs 0090-

0094).

As to claim 20, the combination of Fitton, Smee and Grant teaches wherein

estimating the first and second impairment correlation matrices comprises determining

channel estimates based on the despread symbols (see Fitton paragraphs 0080-0080)

and estimating at least one of the first impairment correlation matrix and the second

impairment correlation matrix based on the channel estimates (see Fitton paragraphs

0090-0094).

As to claim 32, the combination of Fitton, Smee and Grant teaches wherein the

first correlation estimator is a parametric estimator and wherein the first impairment

correlation matrix is a parametric impairment correlation matrix (see Fitton fig. 5,

number 528, paragraphs 00900-0094).

As to claims 41, 49, Filton teaches a method of suppressing interference in a

wireless spread spectrum receiver comprising: despreading symbols received over

multiple paths of a multi-path channel; estimating first and second correlation based on

the despread symbols (see fig. 5, numbers 514 1-N, paragraphs 0090-0094); deriving a

final correlation based on the first and second impairment correlation (see fig. 5,

numbers 528, paragraphs 0090-0094); and combining the despread symbols using

weighting factors determined from the final correlation to suppress the interference (see

fig. 5, number 528, paragraphs 0090-0094). Fitton fails to teach wherein the correlation

is the correlation matrix. Smee teaches wherein the correlation is the correlation matrix

(see fig. 13, number 308, col. 22, lines 23-65). Therefore, it would have been obvious to

one of ordinary skill in the art at the time the invention was made to provide the teaching

of Smee into the system of Fitton in order to trade off noise suppression through

averaging and ability to track channel variation. The combination of Fitton and Smee

fails to teach wherein the correlation is the impairment correlation. Grant teaches

wherein the correlation is the impairment correlation (see paragraphs 0033, 0035, 0039-

0041). Therefore, it would have been obvious to one of ordinary skill in the art at the

time the invention was made to provide the teaching of Grant into the system of Fitton

and Smee in order to detect the signal of interest within the received composited signals

Allowable Subject Matter

2.   Claims 5, 6, 8-11, 17, 25, 27-30, 33-34, 45, 53 are objected to as being

dependent upon a rejected base claim, but would be allowable if rewritten in

independent form including all of the limitations of the base claim and any intervening

claims.

As to claim 5, the applied reference fails to teach wherein combining the first and

second impairment correlation matrices comprises: subtracting a filtered version of the

first impairment correlation matrix from the second impairment correlation matrix to

generate a residual correlation matrix; and adding the residual correlation matrix to the

first impairment correlation matrix to derive the final impairment correlation matrix as

cited in the claim.

As to claims 6, 25, the applied reference fails to teach wherein deriving the final

impairment correlation matrix from the first and second impairment correlation matrices

comprises: subtracting a filtered version of the first impairment correlation matrix from

the second impairment correlation matrix to generate a residual correlation matrix;

filtering the residual correlation matrix; augmenting the first impairment correlation

based on the filtered residual correlation matrix to generate an augmented correlation

matrix; and deriving the final impairment correlation matrix based on the augmented

correlation matrix as cited in the claim.

As to claims 8, 27, the applied reference fails to teach wherein deriving the final

impairment correlation matrix based on the first and second impairment correlation

matrices comprises: computing a whitening matrix based on the first impairment

correlation matrix; applying an inverse of the whitening matrix to the second impairment

correlation matrix to generate a final residual correlation matrix; and combining the first

impairment correlation matrix with the final residual correlation matrix to derive the final impairment correlation matrix as cited in the claim.

As to claims 9, 29, 53, the applied reference fails to teach wherein deriving the final impairment correlation matrix based on the first and second impairment correlation matrices comprises: computing a whitening matrix inverse based on the first impairment correlation matrix; applying the whitening matrix inverse to the second impairment correlation matrix to generate a final residual correlation matrix; augmenting the first impairment correlation matrix based on the final residual correlation matrix to generate an augmented correlation matrix; and deriving the final impairment correlation matrix based on the augmented correlation matrix as cited in the claim.

As to claim 10, the applied reference fails to teach wherein estimating the second impairment correlation matrix based on the first impairment correlation matrix comprises: generating a whitening matrix based on the first impairment correlation matrix; computing a whitened error vector based on the whitening matrix; and estimating the second impairment correlation matrix based on the whitened error vector as cited in the claim.

As to claim 17, the applied reference fails to teach wherein estimating the first and second impairment correlation matrices comprises estimating the first and second correlation matrices for multiple time slots of a received signal, and wherein deriving the final impairment correlation matrix based on the first and second impairment correlation matrices comprises selecting the first impairment correlation matrix as the final

impairment correlation matrix for the time slots when a color of the first impairment correlation matrix meets or exceeds a predetermined color criteria as cited in the claim.

As to claim 28, the applied reference fails to teach wherein the correlation processor comprises a converter to apply an inverse of a whitening matrix to the second impairment correlation matrix to generate a final residual correlation matrix, wherein the first correlation estimator applies the final residual correlation matrix to the first impairment correlation matrix to generate an augmented correlation matrix and wherein the correlation processor derives the final impairment correlation matrix from the augmented correlation matrix as cited in the claim.

As to claim 33, the applied reference fails to teach wherein the parametric estimator comprises: a correlation computer for measuring impairment correlations based on the despread values; a structure element computer for determining structured elements of an impairment model based on channel estimates; a parameter estimator for determining model fitting parameters based on the structured elements and the measured impairment correlations; and an impairment correlation calculator for calculating the first impairment correlation matrix based on the model fitting parameters and the structured elements as cited in the claim.

As to claim 45, the applied reference fails to teach wherein estimating the second impairment correlation matrix based on the first impairment correlation matrix comprises: generating a whitening matrix based on the first impairment correlation matrix; generating a whitened error vector based on the whitening matrix; and

estimating the second impairment correlation matrix based on the whitened error vector as cited in the claim.

Response to Arguments

3.   Applicant's arguments with respect to claims 1-60 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

4.   Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nhan T. Le whose telephone number is 571-272-7892. The examiner can normally be reached on 08:00-05:00 (Mon-Fri).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Edward Urban can be reached on 571-272-7899. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
